

ABSTRACT

A golf club head that includes a hosel and a metal blade. The metal blade includes a knife-like leading edge at the juncture of the sole and striking face, a sole with a rounded protrusion, and a rear face that extends from the sole's protrusion to the trailing edge of the striking face. The knife-like leading edge allows the club head to easily cut through high grass behind the golf ball, thus prohibiting the grass from turning or twisting the club head. The rounded protrusion of the sole prevents the head from cutting too deeply into the ground surface.
